## National Accounts

1436/1437H  
2015

## Introduction

GASat is pleased to provide (KSA National Accounts Bulletin) of the year 2015, corresponding to 1436/1437H. The Bulletin comprises tables on gross domestic product (GDP) at current and constant prices. It measures the shares of institutional sectors and different economic activities in GDP, as well as expenditure patterns such as government consumption expenditure, private consumption expenditure, capital formation, and exports and imports, at current and constant prices.

Besides, the Bulletin includes indicators on gross national income (GNI) and its allotments such as workers' remunerations, operating surplus, and net transactions with world countries, as well as indicators on the available income and its distribution on saving and consumption. It also provides many analytical tables that highlight the national economic trends, such as the GDP annual growth rate and its components, as well as the interrelated relations among the main economic aggregates.

In this regard, GASat would like to extend thanks for Saudi ministries and governmental institutions, as well as private companies and organizations for providing the required data. Their support has proven essential for GASat to issue the Bulletin.

GASat hopes that the Bulletin meets the needs of decision-makers, planners, researchers, businessmen, and all beneficiaries.

GASat welcomes any notes or suggestions that aim to develop the Bulletin.

May Allah grant us success!

## I. Glossary of Terms

### Gross Product

It is the value of goods and services produced during the stated accounting period, including unfinished and self-use products. The value of gross product is usually measured by using the product price.

### GDP (by production approach)

Gross Domestic Product (GDP) is the sum of values added by the domestic producers to the product price, plus customs tariffs. It is alternatively defined as the sum of all outputs, less the sum of intermediate consumption plus net taxes on products (taxes, subsidies, etc) not included in the values of outputs.

### Domestic product at market prices (by expenditure approach)

It is the sum of final expenditure at purchasing prices, including exports estimated by free-on-board shipping (FOB), less values of imports.

### GDP (by cost structure approach)

It is the sum of workers' remunerations, net taxes, operating surplus, and consumption of fixed capital.

### National income

It is the GDP less the preliminary incomes paid to the unestimated units, plus the preliminary incomes received from the unestimated units.

### Intermediate consumption

It is the value of goods and services used as inputs for production process, excluding the fixed assets whose consumption is regarded as consumption of the fixed capital.

### Disposable income

It is the national income at market price, plus net current transfers from abroad.

### Workers' remunerations

Remunerations are the total sums, in cash or in kind, payable by enterprises to employees in return for work before deducting premiums of social insurance, taxes, etc.

### Operating surplus

It is the added value less the value of employees' remunerations, net indirect taxes, and consumption of fixed capital.

### Indirect taxes

The term refers to the taxes imposed on producers for producing, selling, buying, or using goods and services. Indirect taxes are usually added to production costs, and include customs fees.

### Production subsidies

They include grants payable by the government to the current account of private and public sectors, and grants offered by government agencies and State institutions to government projects to compensate the loss resulting from a governmental policy aiming to keep price

at a certain level. They may be measured as the difference between the target price and the actual market price paid by the purchaser.

### Net indirect taxes

They are the value of indirect taxes less the value of production subsidies.

### Indirectly measured financial intermediation services

It is the difference between interest value and profits payable to banks and financial institutions on the one hand, and the value of interests payable to depositors on the other hand.

### Marketable goods and Services

The term refers to the value of goods and services which are sold in the market, or which are primarily manufactured to be sold in the market at a price intended to cover production cost. They include all goods and services domestically produced or imported from abroad, except the direct purchases from abroad by the government and the households.

### Non-marketable goods and Services

The term refers to the value of other goods and services which are offered at a price that does not usually cover production cost (for free or at a nominal price). Most of them consist of the production of government services producers and non-profit institutions serving households.

### Fixed capital depreciation

It is the decrease of the value of fixed assets used in production during the accounting period as a result of deterioration, obsolescence or wear and tear. This consumption may be subtracted from gross fixed capital formation (GFCF) to get the net fixed capital formation.

### Trade margin

A trade margin is the difference between the actual or imputed price by the purchaser for a commodity purchased for resale (either wholesale or retail), and the price that would have to be paid by the distributor for the commodity at the time it is sold or used. The outputs of wholesale and retail trade are measured by the sum of trade margin values realized on the goods purchased for resale.

### Imports of goods and services

The term refers to the value of the goods whose ownership moved from the non-residents to the residents, and to the services provided by the non-resident producers to the residents. They include goods and commodities which cross borders for preparation purposes, as well as the commodities which are prepared in foreign ports and are transported by local carriers and non-cash gold. Those services include transportation, tourism, communication, insurance, construction, and financial services, as well as franchising, licensing fees, and personal, cultural and non-

governemental services not elsewhere classified.

### Exports of goods and services

The term refers to the value of goods and services whose ownership moves from the residents to the non-residents. They include the exports of goods exported to be prepared and the goods purchased in local ports by non-resident carriers and non-cash gold. The exports of services include all services provided for non-residents such as transportation, tourism, communication, insurance, financial, franchising, and business services as well as personal, cultural, entertainment, and governmental services.

### Government final consumption expenditure

The value of as much of the general government for the production of goods and services that self-consumed that is, it is equal to the total production of the government value minus the total of marketed and non-marketed sales value, taking into account that the total government output value equals the sum of the value of intermediate consumption of goods and services and the value of employee compensation and amortization of fixed capital and net indirect taxes.

It is the value of general government expenditure on self-consumed goods and services; i.e. it equals the value of government total production less total value of marketable and non-marketable sales, considering that the total value of government production equals the total value of intermediate consumption of goods and services plus the value of workers' remunerations, consumption of fixed capital and net indirect taxes.

### Household final consumption expenditure

It is the value of the expenditure of the resident households on goods (durable or non-durable) and services, less sales of used goods.

### Private final consumption expenditure

It is the value of the final consumption of resident households and non-profit institutions which serve households.

### Gross fixed capital formation (GFCF)

It is the sum of fixed assets owned by the producers less the value of the fixed assets disposed of by the producers (additions, subtractions, etc) during the accounting period, plus the additions to non-productive assets such as land reclamation, forest expansion and development, aquaculture, gardens, etc., which take more than one year. They also include livestock of farm and milk-producing animals etc.. They include, besides, costs of

transfer of property concerning buying and selling of lands, mines, forests, etc.

### Stock Change

The term refers to the market value of the change, occurring during the accounting period, in raw materials, unfinished products, finished products, animals intended for slaughter, and goods purchased for resale. It equals the difference between the values of the inventory at the beginning and end of the said period.

### Gross capital formation

It is the value of fixed capital formation plus stock change.

### Fixed assets

They are productive assets repeatedly or continuously used in production operations for a period of time exceeding one year. The fixed assets do not only include machinery and equipment, but also include different assets such as trees and animals which are repeatedly or continuously used for the production of other products, such as fruits and dairy products. Besides, they include intangible assets such as computer software and artwork used in the production.

### Property income

It is the income received by the owner of unproductive financial or tangible asset for providing money or for putting the unproductive tangible asset at the disposal of other institutional unit. The financial

instrument usually determines the terms and conditions of property income payment. Property incomes include interests, profit distribution, distributed shares, withdrawal from the income of quasi-corporation, revenues of reinvested direct foreign investment, and property income payable to insurance policy holders as well as revenues.

### Interest

It is a form of property income that is received by the owners of specific types of financial assets such as deposits, securities other than shares, loans and other creditor accounts. The interest is defined as the sum that the debtor is liable to pay to the creditor over a given period of time by virtue of terms and conditions of the financial instrument agreed upon by debtor and creditor, without decreasing the value of the original debt.

### Shares

The term refers to the value of income payable for shareholders as a result of putting their money at the disposal of companies. It is a type of property income.

### Rental

It is the net rental value payable as a result of the exploitation of agrarian lands for the purpose of agriculture as well as the revenues of in-ground assets. It may be paid in cash or in kind. It is one of the forms of property income.

### Current transfers

The term refers to the value of transfers made between the dealers in the form of non-capital transfers.

### Economic sectors (dealers) (According to UN System of National Accounts [SNA])

According to this system, dealers are classified into:

#### First: Productive sectors

##### 1- Producers of Goods and services

This category includes all establishments and other public and private productive units producing goods and services to be sold at a price covering production costs, as well as government units selling goods and services to the citizens in accordance with a certain policy at prices that may not cover production costs, the economic units producing goods and services for self use and the housing buildings inhabited by their owners. It also includes resident units that deal with financial commitments and rights in capital market and non-profit private units which primarily serve business sector, and are totally or partially financed and administrated by enterprises of that sector.

##### 2- Producers of government services

This category covers all government authorities, central and local administration units, defense, security and justice bodies,

### Saving

It is the value of the difference between the proceeds and the current expenditure

They are represented in those who make deals related to production accounts, consumer expenditure, and capital formation which are concluded in the economic units where production decisions are taken.

This group of dealers includes the following:

and units specialized in economic development planning, social welfare planning, education, health, culture and social services which are provided for free or for a nominal price that does not cover production cost. It also includes social security corporations, whether these units are financed by the regular budget or not, including embassies, consulates, and state military units abroad.

##### 3- Producers of on-profit private services serving households

It includes the units which basically provide social services for the households for free or at a nominal price that does not cover production cost. They are not financed or administrated totally or partially by government authorities.

##### 4- Households (domestic services)

They are the services the households provide for one other; such as servants, cooks, nursemaids, nurses, drivers, and

gardeners... etc. These services are considered a part of the national

## II. Institutional sectors

The dealers are classified into sectors working in the field of expenditure and

### 1- Non-financial corporations

They are the joint-stock and quasi-joint-stock projects working primarily in economic activities other than financial and credit services.

### 2- Financial corporations and institutions

They include joint-stock and quasi-joint-stock projects practicing financial operations in the market. These operations are represented in finding financial rights and commitments.

### 3- General government

It includes all local or central government authorities, agencies and institutions, in addition to social security corporations, non-profit institutions serving government bodies. They are not considered complementary to them, and are financed and administered primarily by general authorities. It also includes productive

production represented only in the value of workers' remunerations.

income account, capital financing account and budget.

This group includes the following:

government projects which primarily produce goods and services for the government itself, or to be sold, on a limited scale, to citizens, excluding other government projects and public shareholding corporations.

### 4- Non-profit private institutions serving households

They include the institutions providing social and collective services for households for free or at a price which does not cover production costs. They are not financed or administered primarily by government units.

### 5- Households

They includes all resident households and all non-financial and non-institutional enterprises owned and administered by resident individuals and which are not classified as a quasi-joint-stock projects. They also include social clubs and the likes.

## Second: Data sources and estimation methods

### First: Institutional sectors

Following are the economic Institutional sectors in KSA, reviewed to figure out each sector, as well as the type and scope of information provided by each sector.

#### 1- Non-financial productive government institutions and corporations

These include all the resident economic productive government units producing goods and services either to be sold in the market at a price meant to cover production cost, or at a lesser price as a result of the government policy to decrease prices or for private use inside the government productive and administrative body.

#### 2- Non-financial joint corporations

These include all resident economic units producing goods and services which are sold in the market at a price that covers production cost. The government shares the property of the capital of these units with individuals and companies

#### 3- Non-financial private corporations

This sector includes all resident productive units owned and administered by the

#### A. Business sector (industry)

This sector includes all productive economic units which produce goods and services to be sold in the market at a price meant to cover production costs or produce these goods and services for self-use. This applies to all economic activities in accordance with the International Standard Industrial Classification of all Economic Activities (ISIC).

This sector comprises the following:

private sector. It is divided into two sections:

##### 3.1. Institutional projects

They are the projects with independent bookkeeping and financial accounts such as joint-stock companies, companies limited by shares, limited-liability companies, simple limited partnerships, collective companies, large individual enterprises with financial accounts separated from the owner of the enterprise, and branches of foreign companies.

##### 3.2. Non-institutional projects

They include small individual projects which do not have independent bookkeeping or accounts and whose financial transactions are difficult to be separated from the owner of the enterprise.

#### 4. Financial corporations

They include the financial bodies primarily dealing with financial transactions in the

market, and those related to financial rights and commitments, in addition to insurance companies.

This concept also comprises Saudi Arabian Monetary Agency (SAMA), the various

### **B. Producers of Govt. services**

These include all ministries and government agencies working in the field of administration, defense, public security educational, cultural, entertainment, development services and other collective services aimed at community development.

They also include government units specialized in providing the repetitive services such as issuance of passports, licensing, and driving licenses, notwithstanding the fact that payments for these services may not cover the current costs of administering these units.

### **C. Household sector**

This sector covers all individuals and households residing within the Saudi territory for more than one year. They might be Saudis or non-Saudis (foreigners). It also includes non-profit private institutions serving households (such as charities, sports clubs and the like).

### **D. The rest of the world sector**

This sector has to do with the Kingdom's transactions with the rest of the world so far as visible and invisible exports and

development funds, commercial banks, insurance companies, and other financial institutions and authorities.

imports and all financial and capital transactions which lead to creating financial rights and commitments for the Kingdom with the rest of the world.

## Second: Estimation methods

### A. Estimates at current prices

#### Agriculture and fishing

Following are the methods used in the economic activities to estimate production, intermediate consumption, value added wages and salaries (workers' remunerations), operating surplus and capital formation elements. This includes plant production, animal production, fishing, and honey production... etc. Estimations are based on the results of the economic research carried out by GStat annually and on the data obtained from the Ministry of Environment, Water and Agriculture. They are derived from the results of censuses and agricultural research conducted by the ministry, and they provide data on production, intermediate consumption, value added, paid wages, operating surplus, and capital formation.

#### Crude petroleum and natural gas

Estimations are conducted according to the information received by GStat from the petroleum companies working in KSA, through the Ministry of Energy, Industry and Mineral Resources.

#### Mining and quarrying

The estimation of the value of production and other elements such as intermediate consumption, value added, wages and

salaries is based on the results of the economic research conducted by GStat.

#### Manufacturing

Manufacturing covers the following sub-activities:

- Manufacture of food products and soft drinks,
- Manufacture of textiles, garments and leather,
- Manufacture of wood and wood products including furniture,
- Manufacture of paper, paper products, printing and publishing,
- Manufacture of chemicals, chemical products, petroleum, coal, rubber, and plastic products,
- Manufacture of non-metallic minerals-except petroleum and coal products,
- Manufacture of basic metals,
- Manufacture of metal products, machinery and equipment, and
- Other.

The different economic aggregates related to production and capital component formation are measured according to this classification and to the information provided by economic research conducted by GStat in this regard.

#### Electricity, gas and water

The estimation of the costs of different production elements and capital formation is made depending on the data provided by

the economic researches conducted by GASTat covering the Saudi Electricity Company, National Manufacturing and Gas Company, and water sources and distribution (National Water Company).

### Construction

This sector covers all building processes (of housing and non-housing buildings alike), as well as road construction and pavement, and construction of bridges, tunnels and railways, in addition to water, sewage, electricity, and telecommunication utilities. This sector covers, over and above, drilling wells, reclaiming land, installing air-conditioning devices, connecting buildings to a water supply and sewerage network, as well as installing sanitary ware and elevators, aside from demolishing buildings, etc.

The adopted estimation approach for this activity leverages a myriad of diversified methods. For example, national accounts variables are estimated according to the results of the economic researches and other sources such as annual final accounts and reports of data sources regarding the expenditure on new fixed assets by type of each asset.

### Wholesale and retail trade, restaurants and hotels

Estimations of this sector depend on the data provided by the periodical economic researches conducted by GASTat in the field of statistics of distribution trade and

purchases value services, sales value, paid wages and salaries, newly-purchased fixed assets and all types of expenditure and other revenues. The production in the field of wholesale and retail trade is estimated as the difference between the value of sales and purchases of goods purchased to be sold without any change whether in form or in content. The production of restaurants and hotels is estimated by revenues for providing meals, accommodation, and hospitality services. Besides, the imports are used as an indicator in completing the estimates of wholesale and retail trade, while number of occupied rooms, number of residents, and total revenues are used as an indicator so far as hotels are concerned.

### Transportation, communication and storage

This sector covers all various units performing the services of this activity such as land, air and maritime transportation, storage, mail and telecommunication services... etc. It depends on the data provided by periodical economic researches conducted by GASTat, which cover the institutions working in this field.

### Finance, insurance, real estate and business services

The economic researches conducted by GASTat periodically are considered the source of information required for the estimation. And since such data cover private sector only, other data, provided at financing funds and the monetary

institutions, are used to complete the framework of this sector. Besides, household expenditure and income survey is used to estimate the value of housing buildings rental, whether paid or measured, i.e. whether these buildings are rented to others or inhabited by their owners.

### Social and personal services

The periodical economic researches conducted by GStat play a key role in providing information required for estimating production, intermediate consumption, paid wages and salaries, value added, capital formation components (new fixed assets purchased by asset type) and the rest of property income terms, in addition to using household expenditure and income to estimate the value of home services provided for households between themselves.

### Producers of government services

State budgets and the budgets affiliated to it, independent budgets, and the final account are considered the main source of data used in getting different economic aggregates. State budget differs from the other regular budgets of companies in the method of preparation and classification, as it is divided into four parts:

**Section I:** It deals with the expenditure on wages and salaries due to be paid for the employees.

**Section II:** It focuses on operating expenditure (rewards, travel expenses, rentals, electricity and water charges, consumer materials and equipment, and subsidies).

**Section III:** It deals with expenditure on maintenance and operation

**Section IV:** It deals with various government investments aspects (spent on projects).

As the State final accounts are classified in accordance with financial classifications, National Income Statistics Department modifies this classification to economic classifications.

According to SNA2008, government production is the sum of expenditure on government employees wages and salaries, current expenditure on goods and services, consumption of capital and net indirect taxes. The expenditure is classified by different functional classification aspects (public services, defense, education, health, social insurance and welfare services, housing and community development, other collective and social services, economic services, other purposes).

## B. Estimations at constant prices

The year 2010 is the base year used for calculating estimations of the national accounts at constant prices. There are different confirmation methods varying

### Agriculture and fishing

The index of production quantities, (plant, animal, and fish production) was used for calculating the product value at constant prices.

### Crude oil and natural gas

Given that produced quantities are provided in barrels, the estimation is conducted depending on the index of those quantities.

### Oil refining

Depending on the availability of the refined product, a quantitative index was created to conduct constant-price estimations.

### Other transformative industries

The index of wholesale prices of those products is used to conduct constant-price estimations.

### Electricity, gas and water

Estimations are conducted depending on the index of sold quantities.

### Construction

The index of wholesale prices of building materials is used to conduct those estimations.

from one economic activity to another according to the available information. Following are the methods used in constant-price estimations:

### Wholesale and retail trade, restaurants and hotels

The general index of wholesale and retail prices, restaurants and hotels is used to conduct estimations (separately from one another).

### Transport and Communications:

Estimations are made at constant prices using the index of transport and communication prices.

### Banking services

An implied index of the GDP (with the financial services excluded) is used in reestimating the current prices compared to the constant prices.

### Rentals (of buildings)

The index of the cost of living of rentals is used to calculate the estimates at constant prices.

### Social, collective and personal services

The index of the cost of living was used in reestimating the numbers at current prices to figures at constant prices.
