## NATIONAL ACCOUNTS INDICATORS

---

FIRST QUARTER  
2018

June 2018

## Preface

The General Authority for Statistics (GASat) has the pleasure to present the national accounts indicators bulletin for the first quarter of the year 2018. The bulletin includes a detailed report about the national accounts indicators for the first quarter of the year 2018. It also contains tables of the Gross Domestic Product (GDP) by economic activities at current and constant prices and seasonally adjusted and institutional sectors, at both current and constant prices and also percent distribution by both economics activates and by institutional.

The GDP by expenditure components (government final consumption expenditure, households final consumption expenditure, gross capital formation, exports and imports) is also elaborated in current and constant prices.

Moreover, the GASat expresses its thanks and gratitude to all ministries, public and private institutions and corporations for providing the GASat with the required data which enables the issuance of this bulletin.

The General Authority for Statistics hopes that this bulletin satisfies all the needs of decision makers, planners, researchers, businessmen and all other beneficiaries.

GASat also appreciates receiving all your comments and suggestions to improve this bulletin.

# First: Definitions and Concepts

## Gross Output

The value of commodity and services resulted from producing activity for institutional units that use input during the accounting period. It includes finished, unfinished and the products produced for own use. The value of output is usually estimated at producer prices, that represents the market value at factory gate.

## Intermediate Consumption

It is the value of goods and services that is used as inputs for the production process excluding fixed assets as their consumption is considered as a consumption of the fixed capital. The used goods and services might be totally transformed or consumed in the production process. Some inputs may emerge again after being transformed or merged with the outputs. There are some inputs that can be totally disappeared such as electricity and other similar services.

## Gross Domestic Product (by production approach)

Gross Domestic Product is equal to the total value added of the resident producers at producer price, in which taxes are added and subsidies are deducted. However, it can be referred to as the total of outputs, from which the intermediate consumption aggregate is deducted, and the net products taxes are added (taxes less subsidies), which are not included in the outputs value.

## Gross Domestic Product (by expenditure approach)

Gross Domestic product is equal to the total of final expenditure at purchasers price including exports at free on board prices (FOB), from which imports are deducted.

## Indirect Taxes

They are taxes imposed on producers for any production, sale, purchase, or use of goods and services, (including import duties). They are usually added upon the production costs.

## Production Subsidies

Subsidies are the government payments awarded to the producers of the public and private sectors. It also includes the public authorities payment for government projects to compensate any loss that results from any government policy to keep the price at a fixed level. The subsidies might also be calculated as the difference between the targeted price and the actual market price paid by the purchaser. This difference must be compensated by government .

## Net taxes on Products and Imports

It equals the value of taxes on products and imports minus the value of subsidies.

## Depreciation of Fixed Capital

It represents the decrease of the fixed assets value, used in production, during the accounting period as a result of a slump, obsolescence, or any deterioration factor. This depreciation could be deducted from the fixed capital formation to get the net fixed capital formation.

## Financial Intermediation Services Indirectly Measured

The difference between the value of accrued interest (revenue) on loans and the value of interest payable to the depositors on their deposits.

## Seasonally Adjusted Gross Domestic Product:

It is the process of removing the effects of seasonal fluctuations such as climatic conditions, public holidays and change in holidays days from Quarterly Gross Domestic Product by Economic activities at 2010 constant prices data.

## Imports of Goods and Services

Imports is the value of goods that have been transferred from being owned by non-residents to being owned by residents in Saudi Arabia. Moreover, the imports include the services provided by non-residents to residents in Saudi Arabia. The imports include, the goods that cross the boards for processing, and the goods that prepared in foreign ports and transported by local transporters, nonmonetary gold. The import services include tourism and transportation services, communication, insurance, construction, financial services, royalties, licenses fees, personal and cultural services, and non-classified government services.

## Exports of Goods and Services

Exports is the value of goods that have been transferred from being owned by residents in Saudi Arabia to being owned by non-residents. The exports include exported goods for processing, goods purchased in local ports by non-residents transporters, and nonmonetary gold. However, the exports of services include all services provided to non-residents such as tourism and transportation services, communication, insurance, financial services, royalties, licenses fees, personal, cultural, and recreation services, and government services.

## Government Final Consumption Expenditure

The value of the total goods and services that consumed by the government in the process of producing the government services. It equals the value of the government total production minus the value of the market and non-market sales. The government production value equals the intermediate consumption of goods and services in addition to the value of the compensation of employees, depreciation of fixed capital, and indirect taxes.

## Households Final Consumption Expenditure

The value of resident households final consumption expenditure on goods (durable and non-durable) and services minus their sales of used goods.

## Final Consumption Expenditure of NPISHs

The value of the resident NPISHs final consumption expenditure on goods and services in the process of producing the services that provided free or at nominal price to households. This equals the value of production (intermediate consumption plus compensation of employees plus indirect taxes plus depreciation) minus market and non-market sales.

## Private Final Consumption Expenditure

Final consumption expenditures of households and the NPISHs.

## Gross Fixed Capital Formation

The values of the net addition of the producers to the fixed assets (additions - eliminations) during the accounting period. In addition to the non-financial non-produced assets such as land improvement, forest development, implantations and groves ...etc. These additions are used for more than one year. They include changes in live-stock such as dairy livestock ...etc. They also include transferring (sales and purchases) property costs regarding lands, forests, and mines ...etc.

## Change in Stock

The market value of change that occurs during the accounting period of stock including raw material, product in process, finished products, animals for slaughtering, and purchased goods for resale. This represents the difference in the stock value at the end and at the beginning of the accounting period.

## Gross Capital Formation

It equals the value of gross fixed capital formation in addition to the change in stock.

## Second: Data Sources and Methods of Estimation

### a) The Estimates in Current Prices

The methods of estimating the intermediate consumption, the production, the value added, and the capital formation by economic activities are presented in the following:

#### Agriculture, Forestry and Fishing

The agricultural activity includes plants and animal production, fishing, forestry, logging, and honey production...etc. The agricultural corporations' quarterly financial statements and reports are the main sources of data in this activity. These statements provide data about the intermediate consumption and production, then the value added is calculated .

#### Crude Oil and Natural Gas

The estimates are prepared based on the information that provided by the oil corporations through the Ministry of Energy and Industry and Mineral Resources .

#### Other Mining and Quarrying

The estimates of production, intermediate consumption and value added in this field are prepared according to the corporations' financial statements and reports .

#### Manufacturing Industries

The manufacturing industries cover a number of economic activities such as:

- Food, beverages, and tobacco.
- Textiles and clothing.
- Leather products and the like.
- Cork and wooden products except furniture.
- Paper and paper products.
- Coke coal and other refined oil products.
- Chemical products.
- Pharmaceutical basic products and other pharmaceutical preparations.
- Rubber and plastic products.
- Non-metallic and metallic products.
- Computers and other visual electronic products.
- Furniture.
- Other manufacturing industries.

The value added in these activities are prepared based on a sample of the industrial corporations' quarterly financial statements and reports.

## Electricity, Gas and Water

It includes the activities of electricity, gas, steam supply, air conditioning, water impoundment, treatment, sanitation and waste disposal...etc.

The Saudi electricity company's quarterly financial statements and reports are the only sources for electricity data. However, the national gas and industry company is the source of gas data. Whereas the national water company is the main source for water production and distribution data. These data are used for estimating the value added according to the production approach.

## Construction

It includes the activities of constructing residential and non-residential buildings. It also includes the activities of civil engineering such as (roads pavement, bridges, tunnels, railways, sewage, water, and sanitation projects, electricity, telephone, well-drilling, land reform, air conditioners, water and sewage conduction, sanitary ware, elevators ...etc).

Moreover, it includes the specialized construction activities like (building destruction, plumbing, heating, air-conditioning ...etc).

The quarterly financial statements and reports of the corporations working in these activities provide the data and indicators needed for estimating the value added in these activities.

Some other sources are also used such as the consumption of some building and construction material...etc.

## Wholesale, Retail trade, Restaurants and Hotels

It includes the activities of wholesale and retail trade, vehicles and motorcycles repair, in addition to the food, beverages, and hotels activities. The estimates of this field depend on data provided by the activity's quarterly financial statements and reports. They also provide data about purchases, sales, wages, goods and services inputs, and other revenues. These data are used to estimate the value added in these activities .

## Transportation, Storage and communication

This activity includes land, pipelines, air, and maritime transportation activities. In addition, it includes storage, post, parcel transportation, and the transportation support activities. Moreover, this activity covers the transportation activities either in public, private, or mixed sectors. It also contains computer programming and publishing activities, consultation experience, information services, programming, and broadcasting activities. The major companies that work in the field of communication, transportation, and storage issue quarter financial statements and reports. These sources are used to estimate the value added of these activities. The production approach is used in estimating the value added .

## Finance, Insurance, Real Estate and Business Services

This includes the financial services, insurance and reinsurance activities, Pension funds, and other supporting activities. It also includes the real estate activities such as renting. In addition, it includes business services such as legal activities, accounting, research, and development and research activities, and advertising and marketing activities. The residential rents are estimated based on data that the 2013 household expenditure and income survey provides. The population growth rates are taken into account. As for business services, the estimates depend on the quarter financial statements and reports of the companies that work in this activity .

## Community, Social and Personal Services

This includes educational services activities, health care activities, in addition to all kinds of creation, arts, welfare, entertainment, and sports activities. Furthermore, it includes computer repairing activities and repairing of personal and housing goods. It also includes organizations with memberships .

Data provided from financial statements and reports is the main source for estimating the value added.

## Government Services

The government sector provides goods and services free of charge or with nominal price. So, there is no market value for the production of government services. Therefore, the government sector production is estimated by expenditure. The production equals the intermediate consumption in addition to the compensation of employees and depreciation. If we deduct the intermediate consumption from the production value (production approach), we get the value added which equals the compensation of employees in addition to depreciation. So, there is no net surplus for the government sector .

The quarterly summary data on revenues and expenses that are provided by the ministry of finance is the only source for estimating the government services value added.

## b) The Estimates in Constant Prices

The year 2010 is considered the base year for preparing the national accounts estimates at constant prices. Different methods of estimation are used for different activities according to the available information of each economic activity. The following are the methods used to prepare the estimates in constant prices:

### Agriculture, Forestry and Fishing

The production quantity index number is used to estimate the product value in constant prices .

### Crude Oil and Natural Gas

Estimates in constant prices are calculated based on the production index of crude oil and natural gas.

### Oil Refining

A quantity index number is created based on the quantities of oil products produced by the refineries. This quantity index used to deflate the value added in current prices .

### Other Manufacturing Industries

The wholesale price index is used to deflate the estimates in current prices.

### Electricity, Gas and Water

Estimates in constant prices are calculated based on the index of sales quantity.

### Construction

The construction material wholesale price index is used as deflator for these estimates .

### Wholesale, Retail Trade, Restaurants and Hotels

Each of the wholesale, retail trade, restaurants, and hotels general index numbers are used as deflators for the estimates in constant prices .

### Transportation, Storage, Information and Communication

The communication and transportation price index numbers are used as deflators to have the value added in constant prices.

### Banking Services

Implicit GDP index is used in re-evaluating the estimates in current prices to estimates in constant prices.

### Rents (buildings)

The rent expense index in the CPI is used to estimate the rent in constant prices.

### Community, Social and Personal Services

The CPI is used in re-evaluating the values in current prices to constant prices.

### Seasonal adjustment:

Seasonal adjustment is carried out with TRAMO-SEATS method based on ARIMA (Autoregressive Integrated Moving Average) model of estimation that suggested by International Organizations.

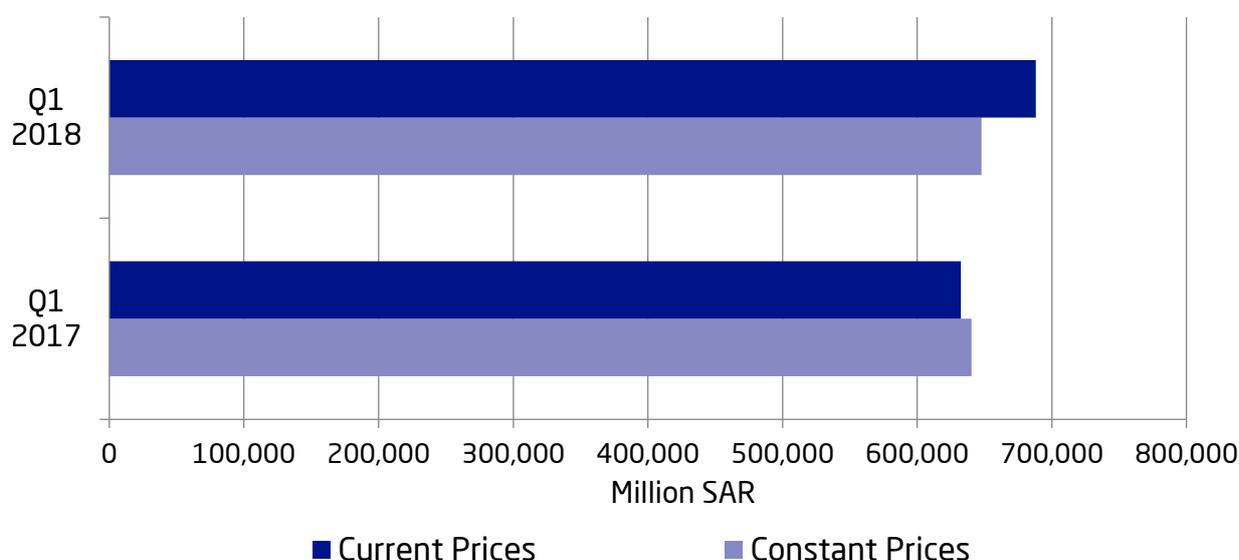

## Third: National Accounts Indicators Report

### 1) Gross Domestic Product (GDP)

GDP value in current prices during the first quarter of 2018 is (688,131) million SAR, with (8.81%) increase compared to its value in the same period of previous year which was (632,422) million SAR.

As for constant prices, it is (647,759) million SAR with a increase by (1.15%) compared to its value in the same period of previous year which was (640,387) million SAR.

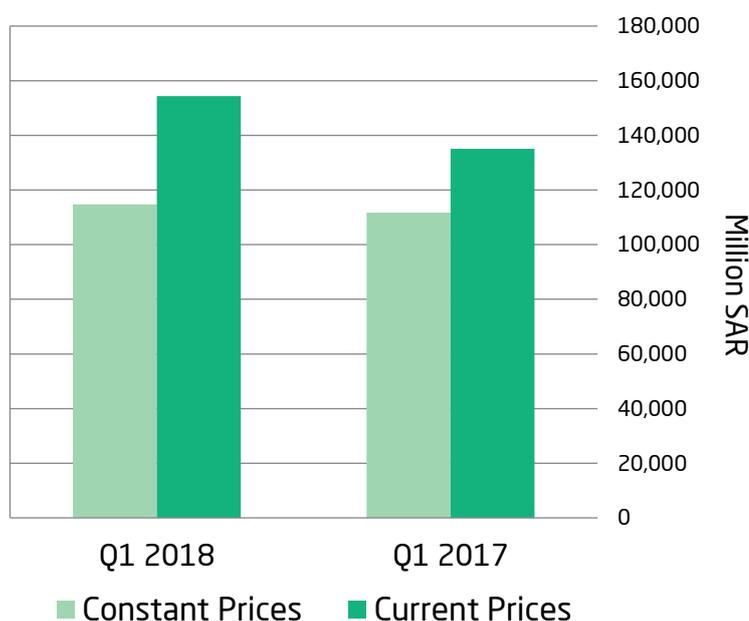

The following are GDP components:

#### A. Government Sector

During the first quarter of 2018, the government sector GDP in current prices is (154,379) million SAR, with (14.32%) increase compared to its value in the same period of previous year which was (135,042) million SAR.

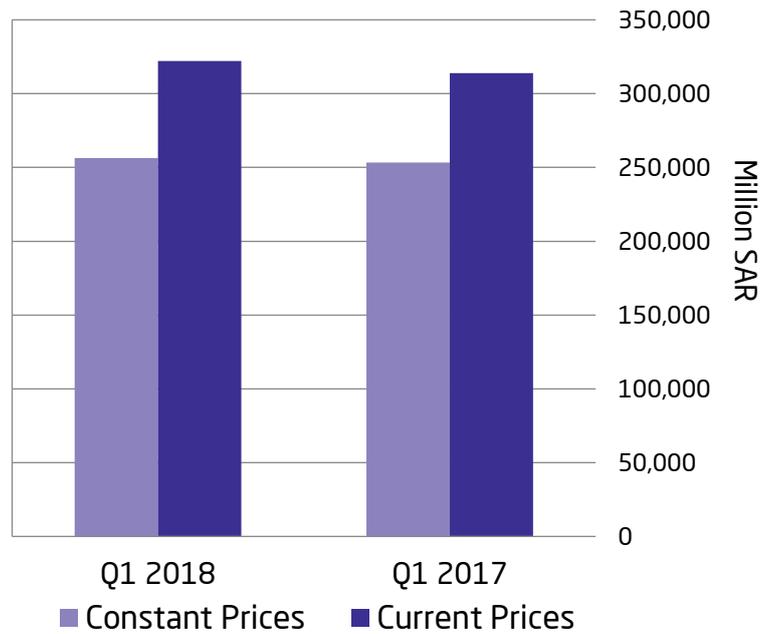

As for constant prices, it is (114,746) million SAR with an increase by (2.72%) compared to the same period of 2017 which was (111,712) million SAR.

### B. Private Sector

During the first quarter of 2018, the private sector GDP increased in both current and constant prices. In current prices, it is (322,165) million SAR with an increase of (2.65%) compared to its value in the same period of 2017 which was (313,848) million SAR.

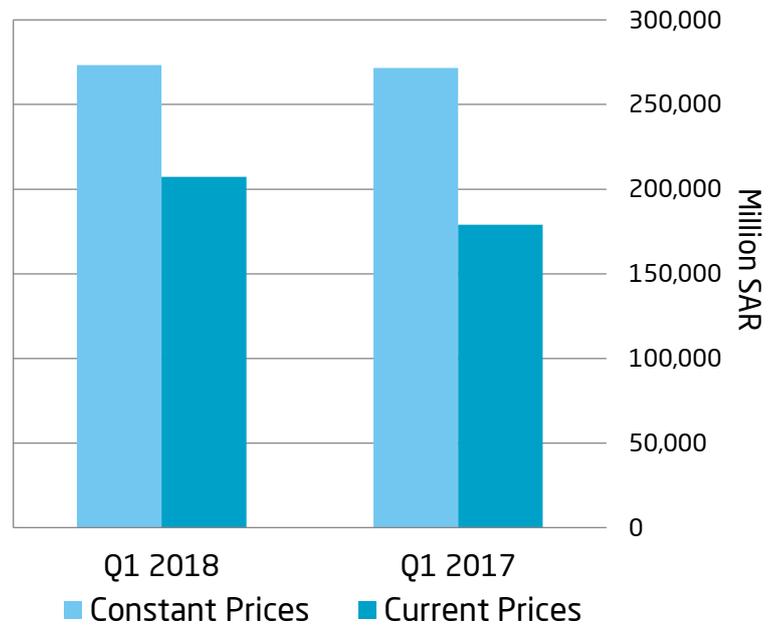

As for constant prices, it is (256,272) million SAR with an increase of (1.12%) compared to its value in the same period of 2017 which was (253,424) million SAR.

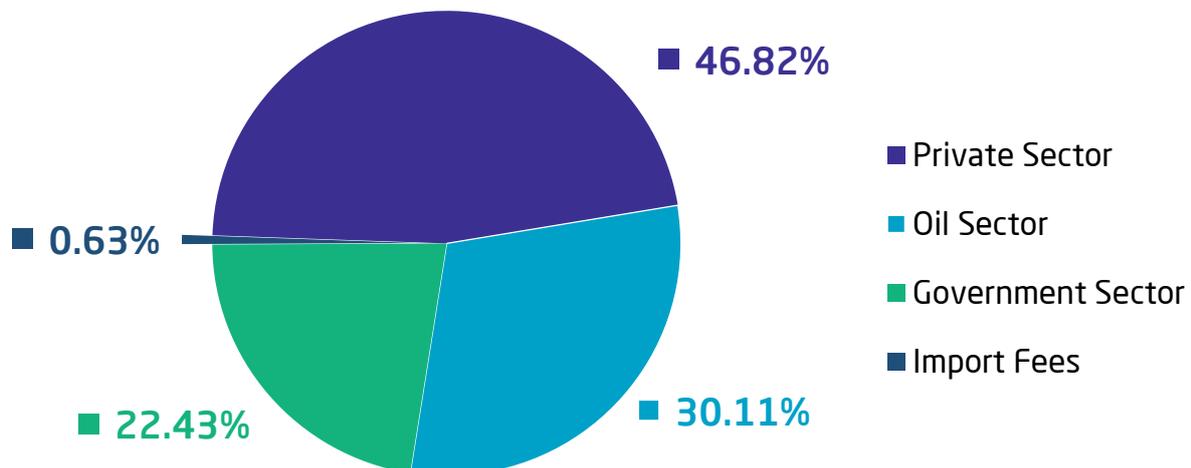

### C. Oil Sector

During the first quarter of 2018, oil sector GDP in current prices is (207,227) million SAR with an increase of (15.78%) compared to the same period of previous year which was (178,983) million SAR.

As for constant prices, it increase by (0.62%) registering (273,280) million SAR in the first quarter of 2018 compared to (271,590) million SAR in the same period of previous year.

### Sectors relative contribution in current prices during the first quarter of 2018

## 2) Local Demand

The primary estimates indicate that the local demand is (602,703) million SAR during the first quarter of 2018 in current prices. It increased with (2.84%) compared to the same period of previous year.

In the following are the main components of the local demand:

### 1. Government Final Consumption Expenditure

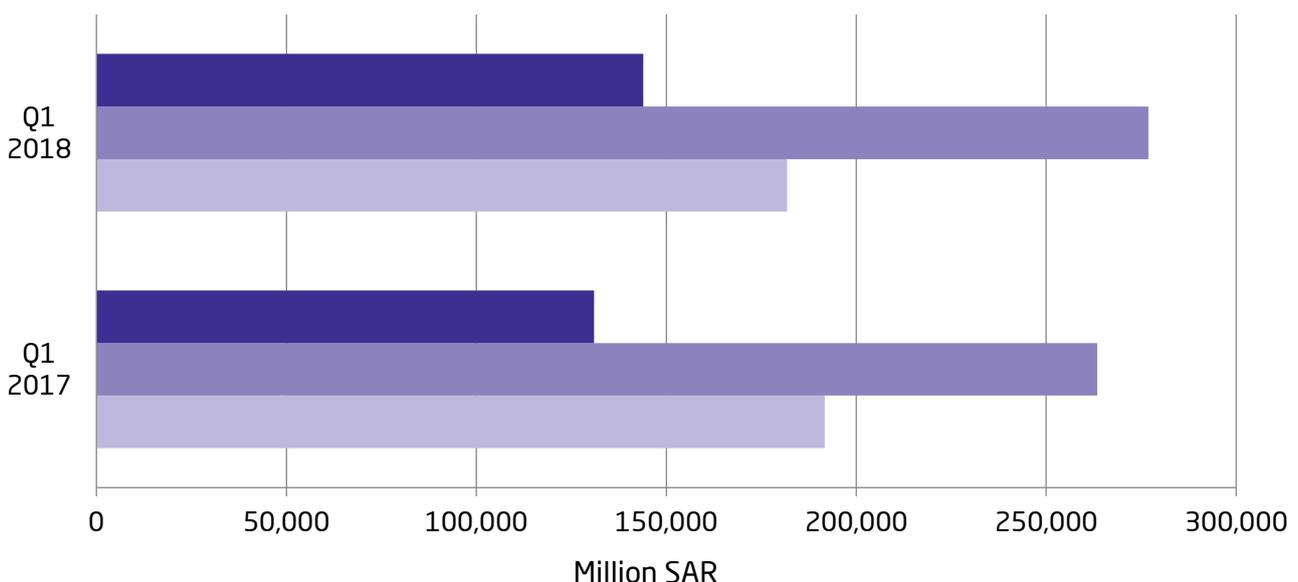

According to the brief data that GStat received from Ministry of Finance about government revenues and expenses. The government final consumption expenditure is (143,980) million SAR during the first quarter of 2018 in current prices. It increased by (9.92%) compared to the same period of previous year in which was (130,985) million SAR.

### 2. Private Final Consumption Expenditure

The private final consumption expenditure is (276,929) million SAR during the first quarter of 2018. It increased by (5.14%) compared to the same period of previous year in which was (263,384) million SAR.

### 3. Expenditure on Gross Capital Formation

The expenditure on total gross capital formation is (181,795) million SAR during the first quarter of 2018. It decreased by (5.17%) compared to the same period of previous year in which was (191,703) million SAR.

- Government Final Consumption Expenditure
- Private Final Consumption Expenditure
- Expenditure on Gross Capital Formation

### 3) Exports and Imports

#### 1. Export of Goods and Services

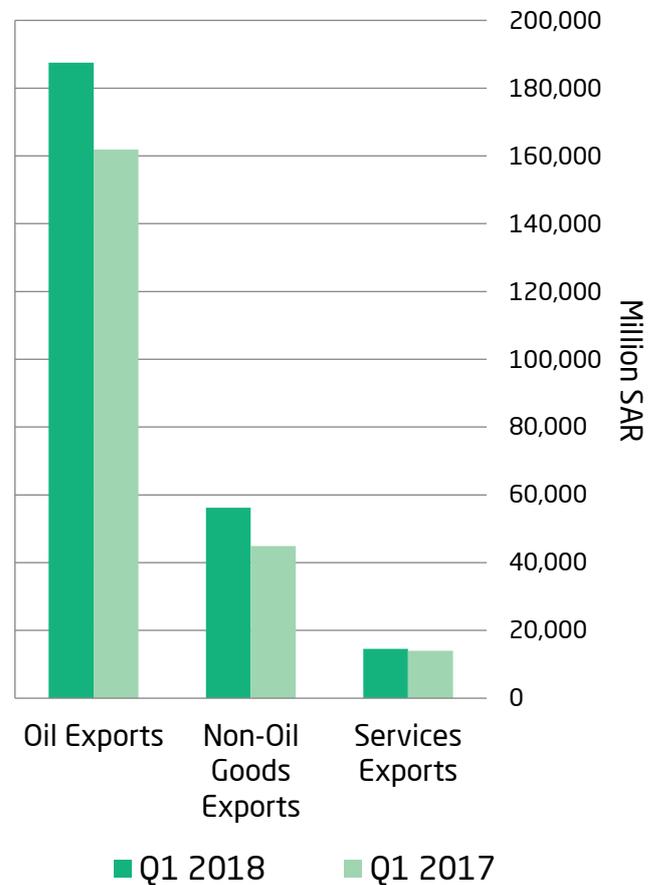

Exports of goods and services is (258,268) million SAR during the first quarter of 2018. It increased by (17.01%) compared to the same period of previous year in which was (220,716) million SAR.

The exports of goods is (243,713) million SAR. It increased by (17.89%) compared to its value during the first quarter of 2017 in which was (206,721) million SAR.

However, the exports of oil is (187,530) million SAR. It increased by (15.85%) compared to its value during the first quarter of 2017 in which was (161,872) million SAR.

On the other hand, the exports of non-oil goods is (56,182) million SAR. It increased by (25.27%) compared to its value during the first quarter of 2017 in which was (44,849) million SAR.

As for the exports of services, it is (14,555) million SAR with an increase of (4.00%) compared to its value during the same period of previous year in which was (13,995) million SAR.

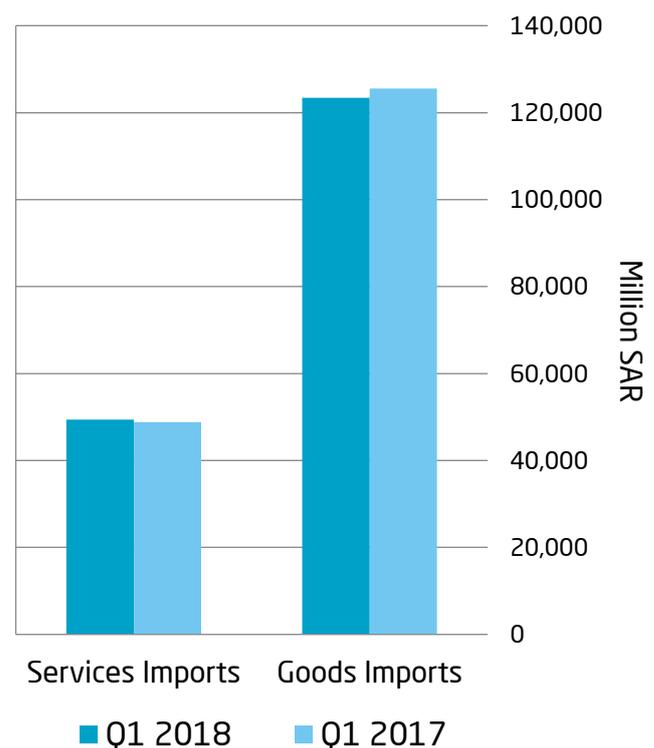

#### 2. Imports of Goods and Services

Imports of goods and services is (172,840) million SAR during the first quarter of 2018. It decreased by (0.88%) compared to the same period of previous year in which was (174,367) million SAR.

The imports of goods is (123,414) million SAR. It decreased by (1.71%) compared to its value during the same period of 2017 in which was (125,558) million SAR.

As for the imports of services, it is (49,426) million SAR with an increase of (1.26%) compared to its value during the same period of previous year in which was (48,809) million SAR.
